

SAP Project- and Portfoliomanagement

Maximizing business value

The Challenge

A successful organization in an ever-changing global environment maximizes business value and aligns activities with strategic objectives.

Processing information from disparate sources within an organization can lead to delays in the completion of projects. Troubled and late projects are hard to monitor and they increase working capital, reduce the amount of available capital which in turn increases the TCO, and reduces ROI and profit margins.

The Solution

Business Value - SAP Project- and Portfoliomanagement 5.0

SAP Project- and Portfoliomanagement is an enterprise-level solution that helps effectively manage a range of portfolios within an organization.

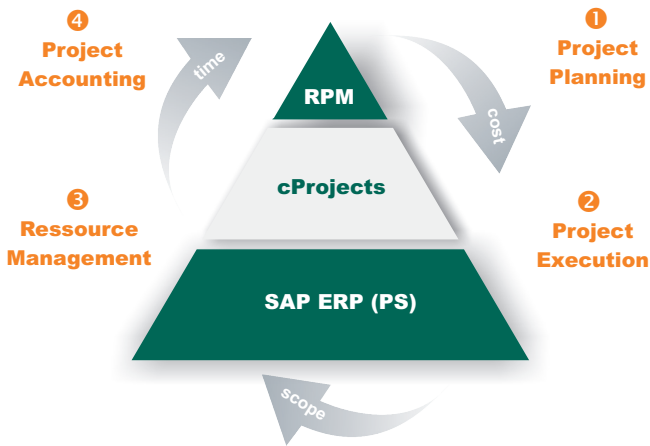

Portfolio management provides a complete view of all projects within an organization. By gathering information from current project management, human resources, and financial systems, it provides the basis for portfolio analysis.

Project Management supports planning, monitoring, and managing all project activities across the entire enterprise. It improves project execution and reduces costs via integration of different back-end systems maintaining project relevant data.

Benefits include

- ✓ Successfully plan, monitor and manage progress of projects in the entire portfolio
- ✓ Early identification of opportunities, bottlenecks, and risks
- ✓ Increase organizational efficiency

In order to ensure SAP's PPM solution is implemented effectively and expected benefits are realized, a systematic approach to a complex implementation is required.

ERP Integrated Scope, Time and Costs Management (Resources and Financials) throughout entire product life-cycle

As a deeply focused and experienced Consulting partner, GOPA ITC can take you there. Our dedicated SAP PLM/PPM consultants have delivered various successful implementations to customers. We know how to balance risk and time to benefit with available project budgets and constraints.
